Kicking wind slabs on Blackmore Trail

Mt Blackmore Northern Gallatin 11/27/2022 Code SS-ASc-R1-D1-O Elevation 8700 Aspect E Latitude 45.44440 Longitude -111.00400 Notes

Toured up to the NE shoulder on Mt. Blackmore yesterday. Winds were strong and variable, but mostly gusting from the S-SW. A lot of snow was moving around, skin tracks were filled in very quickly, and you could actively see small cornices starting to build on the lee side of the ridge.

On the descent, I intentionally triggered a small wind pocket in one of the chutes in the cliffs near the trail at 8700 ft. I included a video. It was D1 and about 5 inches deep at the crown. I think just a good reminder that even in the trees, the tops of those chutes get wind loaded and can definitely <u>slide</u>.
