

Touchy Wind Slabs

Date

Fri, 02/14/2025 - 17:25

Activity

Skiing

Sledded up storm castle. Spent the majority of the day skinning and skiing NE to NW aspects. Found debris from multiple R1-D1 wind slabs from earlier this week. Found widespread but inconsistent wind slabs (2"- 6" thick) at elevations 6700' to 8400'. Throughout the day cracking and collapsing was noticed multiple times on areas of stiffer snow. Snow quality changed dramatically from powder turns to thick wind crust with no visual surface difference.

Region

Northern Gallatin

Location (from list)

Storm Castle

Observer Name

Spencer Lipsteuer
